BID 5074 - POWDERED ACT CARBON
BID 5071 - LIQ ANHYDROUS AMMONIA

J-93-02-06

Dear Council Members:

These chemicals, along with Liquid Ferric Sulfate, Sodium Chlorite, chlorine gas, Soda Ash and Sodium silica Fluoride are the nine bulk chemicals that we use to remove the various impurities from the river water to convert the water to a drinkable condition referred to as "Potable". Liquid Carbon dioxide is used to reduce the high pH to remove excess calcium used in the "excess lime softening process". Pebble lime is the most bulky chemical that removes most of the dirt, bacteria and hardness. Powdered activated carbon is used to remove taste, odor and color (and some volatile solvents, pesticides etc.) Liq. Anhydrous Ammonia is used in combination with chlorine to form Chloramine which is a disinfectant with long acting effects that kills off the pathogenic (disease causing) bacteria that may be in the water after treatment and filtration. Without these 4 chemicals (and the other 5 listed above) we cannot treat the water to make it potable. If you have any further questions, please call me at 427-1254 ext 5338.

Very truly yours,

John McLane, Filtration Plant Superintendent
